CLAIMS

What is claimed is:

- 1. A lookup table comprising:
- a plurality of mappers which are indexed by portions of a search key and partial indexes to output a route index for the search key or partial indexes to subsequent mappers; and

a partial index feedback loop by which a mapper is indexed in multiple passes with multiple portions of the search key.

- 2. The lookup table as claimed in Claim 1 wherein the route index corresponding to the search key is stored in a single location in one of the plurality of mappers.
 - 3. The lookup table as claimed in Claim 1 wherein the length of the search key is variable.
 - 4. The lookup table as claimed in Claim 3 wherein the search key includes a 32-bit IPv4 address.
- The lookup table as claimed in Claim 4 wherein the route index corresponding to the search key is found after a first search of the plurality of mappers.
 - 6. The lookup table as claimed in Claim 3 wherein the search key includes a 128-bit IPv6 address.
- 7. The lookup table as claimed in Claim 1 wherein the partial index is a subtree index.

5

8. A method for providing a longest prefix match for a search key comprising the steps of:

providing plural portions of the search key to successive mappers with partial indexes from prior mappers to index entries in the mapper, each entry storing a route index or a partial index for a subsequent mapper; and

feeding back a partial index from a subsequent mapper to a prior mapper to loop through plural indexes to the prior mapper with plural portions of the search key.

- 10 9. The method as claimed in Claim 8 further comprising the step of:

 outputting the route index corresponding to the search key stored in a single entry in one of the plurality of mappers.
 - 10. The method as claimed in Claim 8 wherein the length of the search key is variable.
- 15 11. The method as claimed in Claim 10 wherein the search key includes a 32-bit IPv4 address.
 - 12. The method as claimed in Claim 11 wherein the route index corresponding to the search key is output after a first search of the plurality of mappers.
- The method as claimed in Claim 10 wherein the search key includes a 128-bit IPv6 address.
 - 14. The method as claimed in Claim 8 wherein the partial index is a subtree index.
 - 15. A lookup table comprising:

5

a plurality of mappers which are indexed by portions of a search key and partial indexes to output a route index corresponding to the search key or partial indexes to subsequent mappers; and

means for feeding back a partial index from a subsequent mapper to a prior mapper to loop through plural indexes to the prior mapper with plural portions of the search key.

- 16. The lookup table as claimed in Claim 15 wherein the route index corresponding to the search key is stored in a single location in one of the plurality of mappers.
- 17. The lookup table as claimed in Claim 15 wherein the length of the search key is variable.
 - 18. The lookup table as claimed in Claim 17 wherein the search key includes a 32-bit IPv4 address.
 - 19. The lookup table as claimed in Claim 18 wherein the route index corresponding to the search key is found after a first search of the plurality of mappers.
- 15 20. The lookup table as claimed in Claim 17 wherein the search key includes a 128-bit IPv6 address.
 - 21. The lookup table as claimed in Claim 15 wherein the partial index is a subtree index.
- 22. A lookup table providing a route index from a search key comprising:

 a first mapper which receives a portion of the search key to index an entry which stores a route index corresponding to the search key or a first partial index to a next mapper;

at least one next mapper which receives another portion of the search key and a partial index to index a next mapper entry which stores the route index corresponding to the search key or a next partial index to a next mapper; and

a selector which selects the next partial index fed back from a next mapper or the first partial index from the first mapper as the partial index to the at least one next mapper.

23. An apparatus for providing a route index corresponding to a search key comprising:

a forwarding engine which receives the search key and provides a portion of the search key as a mapper key; and

a lookup table coupled to the forwarding engine, which receives the mapper key from the forwarding engine, the lookup table comprising:

a plurality of mappers which are indexed by portions of a search key and partial indexes to output the route index to the forwarding engine for the search key or partial indexes to subsequent mappers; and a partial index feedback loop by which a mapper is indexed in multiple passes with multiple portions of the search key.
